### **EXAMINER'S AMENDMENT**

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Leo H. McCormick, Jr. (25,897) on 10/13/04.

The application has been amended as follows:

#### **IN THE SPECIFICATION:**

The abstract has been replaced by the attached abstract.

The above change to the abstract has been made to amend the abstract to less than 150 words.

### **REASONS FOR ALLOWANCE**

The instant invention is deemed to be directed to an unobvious improvement over the invention patented in U. S. Patent No. 4,133,178 to Brooks, Sr. The improvement comprises a master cylinder with a shaft having a peripheral surface with an actuation ramp that terminates at an apex with a retraction ramp for the purposes of eliminating the fluid pressure in the second chamber and the development of any lateral force on the shaft.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue

fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

### PRIOR ART

The patent to Brooks, Sr. is cited for the showing of a master cylinder similar to applicant's but lacking actuation and retraction ramps.

**Abstract:**

A master cylinder having a housing with first and second bores that are connected to a same circuit in a braking system. A first piston is sealingly retained in the first bore to define a first chamber and a second piston is sealingly retained in the second bore to define a second chamber. The first piston has of a first cylindrical member that is connected to a second cylindrical member by a shaft. The shaft includes an actuation and a retraction ramp that terminate at an apex. An input force applied to the second cylindrical member is directly applied through the shaft to the first cylindrical member and through the actuation and retraction ramps to the second piston to respectively communicate fluid simultaneously to the same circuit.
